# Roblox Developer home task brief

## Overview

The goal of this assignment is to evaluate your thinking process, decision-making, and execution ability when building a branded experience inside Roblox.

This task simulates a real-world scenario where you are required to design and implement an interactive campaign within an existing game environment, while working under constraints and partial information.

We are not looking for perfection, but for:

- Clear thinking
- Simplicity
- Strong execution
- Clean and structured code

## Scenario

You are building a campaign for a brand called **FindJob** – a platform that helps users find the career path that fits them best.

As part of the experience, players will encounter an interaction point inside the game, where:

- The player answers **2 short questions**
- Based on their answers, they are matched to one of two fields:
    - Software Engineering
    - Teaching

After the classification:

- The player receives a **tailored mini-mission**
- Upon completion, the player receives a **reward inside the host game**

All in-game content (UI, text, questions, and messaging) should be implemented in English.

The experience should feel like a natural part of the game - not like an external advertisement.

# Your Task

Design and implement a working prototype that includes:

## 1. Player Flow

A clear player flow:

- Entry point interaction
- Question flow
- Classification
- Transition to mission
- Completion + reward

Additionally, include a UI button on screen that allows the player to load and unload the campaign experience. This is intended to simulate how a campaign can be dynamically activated or removed within a host game.

## 2. Classification Logic

Implement logic that maps player answers to one of the two fields.

Focus on:

- Clarity
- Structure
- Extensibility

## 3. Mini-Missions (Key Focus)

Each field should have a different mini-mission.

This is one of the most important parts of the assignment.

We expect to see:

- Actual implementation (not just a concept)
- Clear flow: start → progress → completion
- Defined success conditions
- Player feedback

The emphasis is on **quality of execution**, even if the mission itself is simple.

### 4. Reward Handling

At the end of the mission, the player should receive a reward inside the host game.

You are required to implement a mechanism that enables granting a reward within the host game.

### 5. Tracking & Measurement

Assume there is an external system that receives campaign data.

You should:

- Decide what to measure
- Implement basic tracking logic
- Print tracking results to the console

## Important Note

No models or art assets are provided for this assignment.

This is intentional.

We want to see how you work with limited resources.

## What We Are Evaluating

### 1. Thinking & Structure

- Problem breakdown
- Clarity and simplicity of the flow

### 2. Code Quality

- Clean, readable, and modular code
- Proper client/server separation
- Scalable and maintainable structure

### 3. Mini-Game Execution (Key Focus)

This is a central part of the evaluation.

We will assess:

- Execution quality
- Completeness of the experience
- Player feedback
- Overall feel and flow

### 4. Campaign Understanding

- Connection between questions → classification → mission
- Whether the experience feels like a real branded campaign

### 5. Cross-Game Thinking

The campaign is expected to run across multiple games.

We are looking for awareness of challenges such as:

- Adapting to different host environments
- Handling rewards without full control over the host game
- Consistent tracking across games

### 6. Optimization

- Performance awareness
- Avoiding unnecessary overhead

### 7. Security

- Not trusting the client
- Basic validations
- Preventing logic abuse

### 8. User Experience

- Simplicity and clarity
- Smooth flow
- Clear onboarding

### 9. Measurement Thinking

- What you chose to measure
- Why
- How it reflects campaign success

## Guidelines

- Keep it simple
- Focus on core flow and execution quality
- No need for full polish, but execution should be solid
- You may use any tools (including AI)
- Clearly state your assumptions

## Scope

Not expected:

- Full game
- Advanced design or art
- Production-ready systems

Expected:

- Clear working prototype
- Well-executed mini-missions
- Clean code
- Strong system thinking

## Timeframe

- Recommended effort: 3–5 hours
- Submission deadline: within 5 business days

## Submission

Please submit:

- Project files or relevant link
- A short explanation including:
    - What you built
    - Player flow design
    - What you chose to measure
    - Challenges you identified (especially for cross-game campaigns)
    - What you would improve with more time
